

v2 Rebuild — Complete & Verified

The only BNPL where your payment plan makes you money. Ground-up rebuild, proven against the v1 spec.

25 / 25 INTEGRATION TESTS GREEN	18 V1 CHARACTERIZATION TESTS (FROZEN SPEC)	11 INSTRUCTIONS, ONE MODULE EACH	6 / 6 RUST UNIT TESTS (YIELD MATH)
---------------------------------------	--	--	--

HOW IT WORKS

1 Buyer picks a \$300 item, chooses Relic Pay	2 Agrees to 3 × \$100, 30 days apart	3 Contract escrows funds — escrow earns yield	4 Pays on schedule; yield builds monthly	5 Merchant paid in full. Buyer keeps the yield.
---	--	---	--	---

WHAT V2 FIXED AND ADDED

AREA	V1 (OLD CODEBASE = SPEC)	V2 (REBUILT)
Architecture	One 1,100-line lib.rs	Modular: state / errors / events / math / 11 instruction files
Arithmetic	Saturating (silent failure)	Checked everywhere; explicit MathOverflow error
Security	trigger_default could route escrow to any token account passed in	Recovery account must belong to the recorded merchant
Double-withdraw	Balance check only	merchant_withdrawn flag — structurally impossible
Rent	Locked forever	close_agreement reclaims agreement + escrow rent
Governance	Hard-coded 3% APY	update_pool_rate, authority-only, capped at 20%

TESTING DISCIPLINE

The 18-test v1 suite is **frozen as the specification**. It is never edited to make a change pass — any break is a breaking change requiring an explicit decision. All new behavior lands with new tests. Result: the rebuild passed the entire spec on its first full run.

The 10x Plan

MVP shipped → real yield → merchants → underwriting → mainnet, with a daily swarm driving it.

ROADMAP

v2.0 ✓

Rebuild (done). Hardened modular program, 25/25 tests, demo app + extension repointed at the new program ID. MVP = this + devnet deploy.

v2.1

Real yield — the 10x unlock. Escrow deposited into Kamino Lend via CPI; real USDC APY replaces simulated interest. Fallback to raw USDC so a DeFi outage never blocks a purchase. TVL caps + emergency pause.

v2.2

Merchant surface. @relicpay/checkout SDK, merchant dashboard, browser extension v2. First merchant: IBG Collection (cross-leverage, flagship story).

v2.3

Underwriting. On-chain payment history → credit tiers → lower collateral for proven buyers; pay-from-yield; multi-token collateral via liquid staking.

v2.4

Mainnet. External audit, Squads multisig authority, gradual TVL ramp, legal review of BNPL terms.

GO-TO-MARKET

Never lead with "crypto." Lead with: your payment plan pays you.

- **Proof (wk 1–4):** devnet demo at relicpay.app; IBG × Relic Pay pilot drop; 90-sec demo video (3Shapes)
- **Presence (wk 2–8):** build-in-public on X + Farcaster, 3 posts/wk; extension in Chrome Web Store
- **Capital (wk 4–12):** Colosseum hackathon entry, Superteam / Solana Foundation grants, Kamino co-announcement, 3–5 LA merchant pilots

DAILY-PROGRESS SWARM

- **relicpay-build** (weekdays): one roadmap increment per day; suite must stay green; commits locally, never pushes/deploy without approval
- **relicpay-growth** (Mon/Wed/Fri): grant deadlines, content drafts, merchant pipeline — **drafts only, nothing sent without Walter's sign-off**
- Every run writes **docs/progress/YYYY-MM-DD.md**; decisions flagged NEEDS-WALTER

TARGETS

- 100 completed devnet agreements · 10 real IBG pilot orders
- 1 grant or hackathon placement · 3 signed merchant pilots
